

Activity 08 AI review prompts

Design prompt

Act as a C# reviewer. Work only in this .NET 10 console project. Read the synthetic specification: A warehouse imports synthetic product data using a documented JSON contract. Reject mismatched types and negative stock, preserve UTF-8 names and prove export/import round-trip interoperability. Identify the input/output contract, invariants and error path. Return a short design and three test cases before proposing code. No new dependencies, network calls or file deletion.

Review prompt

Review my Program.cs against requirements.md. Explain each defect using a concrete input and expected versus actual behaviour. Return the smallest C# diff and tests. Do not invent successful test results. If uncertain about an API, point to current Microsoft documentation.

Evidence prompt

Using only my supplied actual build/run output, help me summarize one requirement-to-code-to-test link. Label any assumption. I must explain and approve the change myself.
